

EB1A / E11 Trend Analysis

Illustrated report based on the local USCIS I-140 dataset.

The report asks whether EB1A / E11 denial pressure increased in FY2025 and FY2026 Q1, and whether recent pending inventory should be expected to resolve less favorably than in earlier periods.

- FY2022-FY2025 Q1 E11 denied/decided stays around 25-27%; FY2026 Q1 reaches 52.5%.
- FY2026 Q1 E11 approval/received falls to 28.1%.
- Direct E11 pending conversion is not observable, so EB1 snapshot behavior is used only as a proxy.

Data and Method

The report uses local analysis tables exported from PostgreSQL. The key table is the quarterly RADP-style dataset with TOTAL, EB1, E11, EB2, and NIW rows from FY2022 through FY2026 Q1.

The analysis distinguishes received-basis rates from decided-basis rates. Received-basis rates are useful for workload, but decided-basis rates are better for adjudication severity because pending cases are excluded from the denominator.

For pending conversion, exact E11 cohort tracking is not available in the current source files. EB1 snapshot changes are therefore used as a cautious proxy.

1. Direct EB1A flow signal

The direct E11 quarterly series shows that the recent issue is not just volume. Denials become visibly heavier while approvals no longer keep the same relation to receipts.

Notes: Data source: quarterly RADP-style E11 rows, FY2022 through FY2026 Q1. | This is the cleanest direct EB1A flow chart currently available in the project.

2. Pending inventory becomes part of the story

E11 pending inventory reaches 21,157 at FY2025 Q4 and 24,653 at FY2026 Q1. Fresh periods cannot be read only through approvals and denials because many cases have not resolved yet.

Notes: Pending is a stock/current-status measure, not a clean same-quarter cohort flow. | High pending can hide future denials or approvals that will only appear in later USCIS releases.

3. Denial rates rise, especially on decided basis

Denied / decided is the clearest severity metric because it compares denials only against resolved outcomes. It avoids treating pending cases as if they were already approvals or denials.

Notes: Received-basis rates are useful for workload context but are distorted by fresh pending inventory. | Decided-basis rates are more useful for adjudication severity, though still incomplete for fresh periods.

4. Like-for-like Q1 comparison

FY2022-FY2025 Q1 denied/decided is relatively stable: 26.1%, 25.8%, 26.7%, and 25.3%. FY2026 Q1 jumps to 52.5%, while approval/received falls to 28.1%.

Notes: This is the most intuitive seasonal test: Q1 compared with Q1. | The expanded baseline makes FY2026 Q1 look abnormal against every available Q1 year, not only FY2024/FY2025.

5. Annual E11 denial share

Annual aggregation shows a clear worsening into FY2025, while FY2026 Q1 is much more negative. FY2026 should be read as an early signal, not as a full-year result.

Notes: FY2026 is Q1 only and must stay visually marked as partial. | The annual view is helpful for direction, but quarterly detail is still needed.

6. EB1 proxy for pending resolution

Direct E11 cohort-level pending conversion is not observable in the current files. As a proxy, EB1 FY2025 newly resolved outcomes between the FY2025 Q4 and FY2026 Q1 snapshots show a much higher denial share than FY2024.

Notes: EB1 is broader than E11 and includes E12 and E13. | This proxy does not prove E11 conversion, but it is directionally consistent with a more negative pending outcome mix.

7. Scenario forecast, not a precise prediction

The scenario chart stress-tests how final denial share changes if remaining pending cases resolve under optimistic, observed-base, or pessimistic assumptions. It is a decision-support view, not a direct forecast.

Notes: The base case uses observed EB1 FY2025 proxy behavior. | The chart should be updated after each new USCIS quarter.

Final Interpretation and Caveats

The evidence supports a cautious but materially negative interpretation: the EB1A / E11 environment appears to have worsened in FY2025 and FY2026 Q1.

The strongest direct evidence is the expanded Q1 like-for-like comparison and the E11 decided-basis denial share. The EB1 proxy adds a second warning signal for pending inventory, but it should not be treated as exact E11 conversion.

- FY2026 is currently Q1 only and should not be annualized mechanically.
- RFE is not directly observed in the USCIS aggregate data.
- EB1 includes E11, E12, and E13, so EB1 proxy results can differ from exact EB1A behavior.
- USCIS can revise historical counts between releases.
